

AI FAQ ASSISTANT API

- **Project Title:** "Ai Faq Assistant Api"
- **Team ID:** NM2025TMID38548
- **Team Leader:** M. Divya sree
- **Team Members:**
 - NAME: M.Anusree
 - NAME: N.Deepika
 - NAME: M.Dhivya sree
 - NAME: A.Ambeeleswari

PROJECT DEMONSTRATION PHASE

The Project Demonstration Phase is the stage where the completed **AI FAQ Assistant API** is presented and its working process is explained through a practical demonstration. The main purpose of this phase is to show how the system accepts user questions, processes them, and provides suitable answers through API requests.

1. Introduction

The demonstration begins with a brief introduction to the **AI FAQ Assistant API**, including its purpose, objectives, major features, and technologies used. The project is designed to provide quick and automated responses to frequently asked questions through a simple API-based system.

2. System Setup

The project environment is prepared using **Node.js, Express.js, MongoDB, JavaScript, and VS Code**. The server is started and the database connection is established. The required API endpoints are checked to ensure that the system is running correctly.

3. API Demonstration

The main API functionalities are demonstrated using an API testing tool such as Postman. The demonstration includes:

- Creating and managing FAQ information.
- Sending a question to the FAQ API.
- Processing the user's question.

- Returning a relevant answer.
- Testing valid and invalid requests.
- Displaying appropriate response messages and status codes.

4. Working Process

During the demonstration, a user sends a question through the API. The request is received by the Express.js server and processed by the application logic. The system searches or generates the most relevant FAQ response and sends the result back to the user in a structured format such as JSON.

5. Database Demonstration

The MongoDB database is demonstrated to show how FAQ information and other required data are stored and managed. The process of adding, retrieving, updating, and deleting FAQ records can be shown to verify proper database operations.

6. Error Handling

Different situations are tested during the demonstration, such as missing input, invalid requests, unavailable FAQ information, and database-related errors. The system provides suitable error messages and status codes to help users understand the problem.

7. Final Output

The final demonstration shows the complete flow from **user question** → **API request** → **server processing** → **FAQ/AI response** → **API output**. This confirms that the major functions of the AI FAQ Assistant API are working as expected.

Conclusion

The Project Demonstration Phase validates the practical working of the **AI FAQ Assistant API**. By demonstrating the API endpoints, database operations, question processing, responses, and error handling, the project functionality can be clearly understood and verified.
